Profile

Gytpol is fast-growing - solving a security risk which impacts all organizations which until now a good solution did not exist.

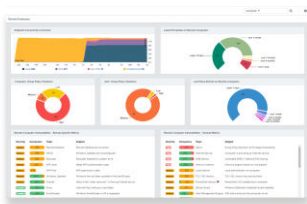

Security risks due to **misconfigurations** are a major pain-point for all organizations. Over 80% of ransomware attacks are attributable to misconfigurations. Today, Secure Configuration Management is non-automated and very manual. This is ineffective, costly and relies on having skilled resources available. This lack of visibility is often why organizations suffer from poor cyber hygiene which leads to a successful attack.

Solution at Glance

Gytpol is a Security Configuration Management platform. Providing continuous monitoring and **automatic remediation with zero impact** of security risks caused by misconfigurations and non-compliance on endpoint devices. It's fast, accurate & secure. Gytpol stops breaches, reduces risk and saves organization significant time and cost. Gytpol is already supporting over 3 million devices worldwide.

How It Works

Deployed as either a SaaS or On-Premises, Gytpol Validator will monitor, detect and remediate misconfigurations on Windows, Linux and Mac Devices (IoT support coming in 2023), whether they are connected to the network or working from home remotely. The dashboard is easy to use and intuitive. Gytpol also integrates with SIEM with API access for third-party applications.

Video

Gytpol can be used for:

- Ensuring security baselines are secure with the latest hardening requirements
- Validating Group Policies are applied on all endpoint devices
- Continuous audit and healing for regulatory compliance on all devices (CIS, NIS, Cyber Essentials etc)
- Remediation of Zero Days without patching (where possible)
- Detection of lateral movement
- Detection of Active Directory misconfigurations
